0.1 Introduction

##talk about the importance of hacking, percentage of data loss link it with the data collected

0.2 stats about data breach

Multiple institutions have been a target of increasingly more disruptive or destructive cyber attacks over the last few years which has lead to government action.

The data used in my work was collected yearly by the uk government department for Digital, Culture, Media and Sport (DCMS) with the purpose of helping the government understand the importance cyber security

for British institutions, better shape policy regarding cyber security, create schemes to increase awareness for such problems and better protect institutions form cyber security threats.

The data collected contains information detailing the attacked institutions, the countermeasures in placed before and after the attack, the type of attack and it's affects on the company.

As such this analysis will investigate the relationship between how institutions protect themselves from cyber attacks and the affect of said attacks on these institutions in the last 5 years.

0.3 Objectives of this report:

-Creating of a new tidy data set for each of the years including recompiled variables for the management, policing and rules implemented to protect the organisation, the type of attack that affected the institution and its respective outcomes.

-Utilizing Multiple Imputation by Chained Equations (Mice), to replace the missing data.

-Do hypothesis testing on my new fitted models to compare how the size of an institution will affect the time needed to restore business operations.

-Mention the limitations of this analysis.

-Conclusion with recommendation for future research.

0.4 Report structure

This report will be structure in the following order, firstly I will be describing the data set in more detail and my tidying process, secondly I will talk about my methodology for data analysis, afterwards in my results I will be displaying a visual analysis of the data, test results and it's meaning, afterwards I will discuss the limitations of my data and lastly conclude discussing the implications of my results for future research and the industry.

0.5 Data set

The data sets contain the data used for the statistical analysis done by the uk government DCMS department, they were collected and published in the uk data service, however they have not been made completely public and require a request and its approval to obtain access to each of the data sets.

Each one of these data sets contain the data associated to institutions affected by cyber attack with its multitude of implications for costs, business downtime, reporting and outcome as well as a detailed description of the policies, rules and investment in security measures to counter such security threats and some key parameters to describe the institution such as size, market sector and better contextualize the data.

Initial data wrangling:

Due to the untidy state of the data collect via the random probability telephone survey, these data sets containing between 421 to 462 variables have to been clean up into 21 easily comparable variables.

The clean up process consisted of computing new variables utilizing the multiple subcategories of answers to the survey questions, grouping them into more flexible options while adjusting missing values to allow for such computation maintaining the original binary design and increasing the scale of the size variable to

produce better grouping and latter on better imputations due to the data sets didn't had the distinction between the intervals [250, 999] and [1000, ∞] that was present in the survey.

I also had to remove a few results from each year data set because these institutions still had their systems down after being attacks and since I don't have the information of the data of the attack and the data of the survey for those particular institutions it is impossible for me to quantify the time for restoring their systems, creating this way data that doesn't give us any possible information about the topic but is not missing, so it should not be replaced with missing data for computation.

There was also a further cleaning of the data sets by removing variables that were unused and not relevant to my my hypothesis and its associated testing

The data sets were previously compiled and run in SPSS which is a statistical software developed by IBM for data analysis, therefore all the data in the data sets were in SPSS data structures that needed to be converted to R structures such as numeric and factor to allow for imputation and model fitting.

0.6 Methodology

The process of the methodology will be starting with a simpler hypothesis test based on mean comparison to discovers the relationship between size and restoration and how much it varies compared to my null hypothesis. Afterwards I will check the p-values to understand how likely it is that the relationship described if the null hypothesis of no relationship is true. If the test is more likely than the null hypothesis, I can infer that exists a statistically significant relationship between size and restoration time. If the test however is less likely than the null hypothesis, I can infer that there is no statisitcally significant relationship (Bevans 2022)

0.7 Results

0.8 Missing data

It can be observed a significant degree of missing data on my data sets coming from multiple sources, the main source of missing data is derived from a limitation of the data collected, the lack of reporting channels in institutions leads to the majority of the missing values that lead to direct missing data in the data sets collected and indirect missing data by institutions answering that they do not know the answer to some of the questions in the survey. Lastly there is missing values associated to the type of attacks by institutions refusing to answer the question regarding the type of attack inflicted in their respective institution.

The missing data will have to be imputed using Multiple Imputation by Chained Equations on each of the data sets, for this I will be using the R library mice created by professor Stef Van Buuren.

For the imputation we had the consider the 3 following parameters, number of imputations, number of iterations per imputation and method for imputation.

The number of imputations was chosen following two rules, the first one is Relative Efficiency (RE) is lower with a higher number of imputations according to Rubin's formula RE=1/(1+(FMI/m)), where FMI is approximately equal to the percentage of missing data and m the number of missing data. (Rubin 1975) The second was a rule of thumb described in the book "Multiple imputation using chained equations: Issues and guidance for practice" where they recommended to equate the number of imputations to the percentage of missing data in each of the data sets which is what I will be using. (White, Royston, and Wood 2010)

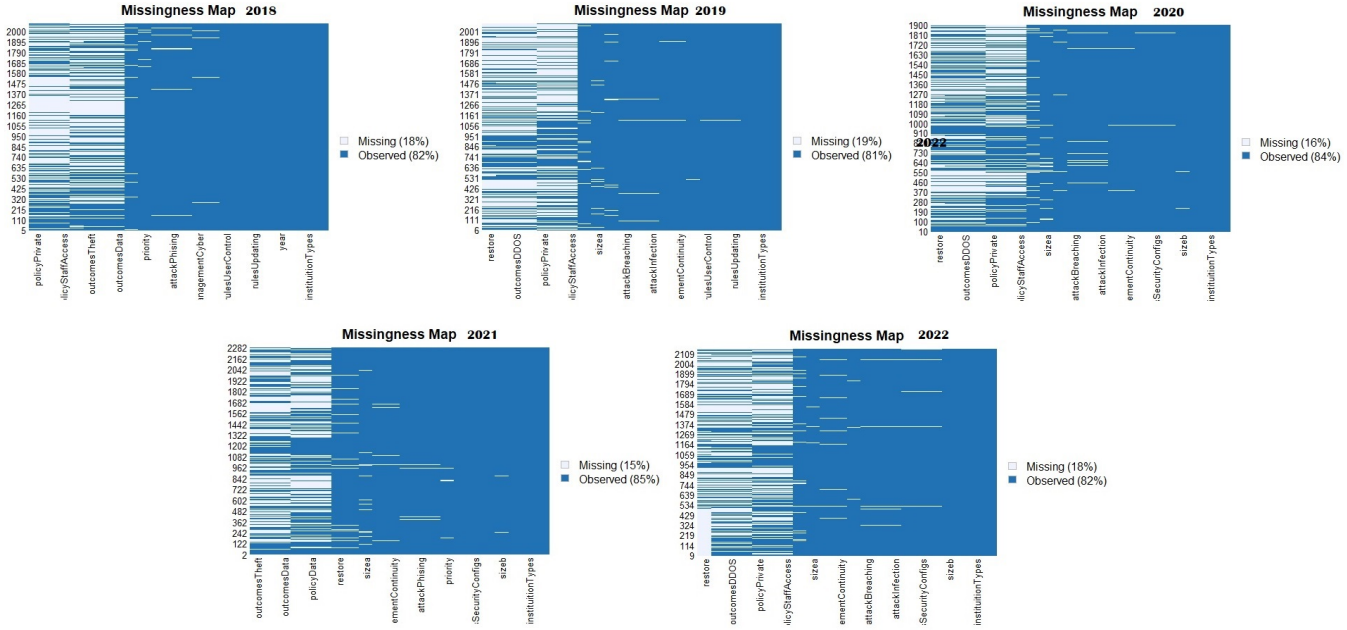

Figure 1: Missingness Map from 2018 to 2022

The number of iterations was chosen based on the convergence, that is when plotting the imputations the variance between the imputation chains is close to the variance of the chained imputations which is an indicator of an healthy convergence, this convergence was achieved after multiple trials with different numbers of iteration. (“Book_MI.knit” 2022)

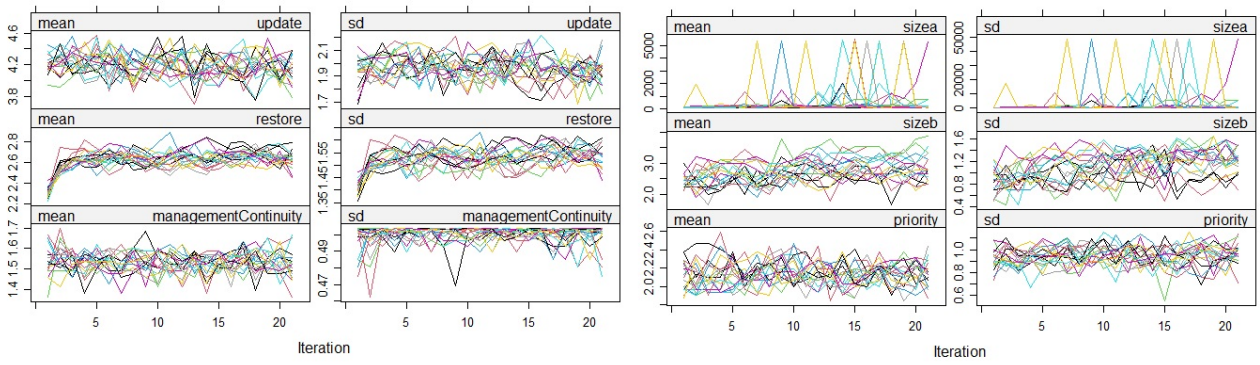

Figure 2: Healthy convergence plot

The prediction matrix is a matrix which tells mice which variables can be used to predict missingness in the other variables. Mice by default uses the correlation between and the proportion of usable cases. For the prediction of the exact number of employee however prediction based only on the scale of size of the institution to avoid predicting values outside of the already known scale level of the institution when imputing the missing values.

Lastly for the method of imputation I choose not to use the default method ppm which is more appropriate for continuous data, most of the variables were imputed with the method of logical regression “logreg” due to the nature of the majority of the values being dichotomous binary variables, the numerical variable

was instead imputed with the method of polynomial regression "polyreg" because size has a discrete finite number of values. ("Book_MI.knit" 2022)

0.9 Visual analyses

After dealing with the missing data and having a complete data set we can start our exploratory analysis. This analysis require us to first visualize the data to find any obvious patterns or groupings. Given the nature of the data a box plot will the most effective at displaying the concentration of

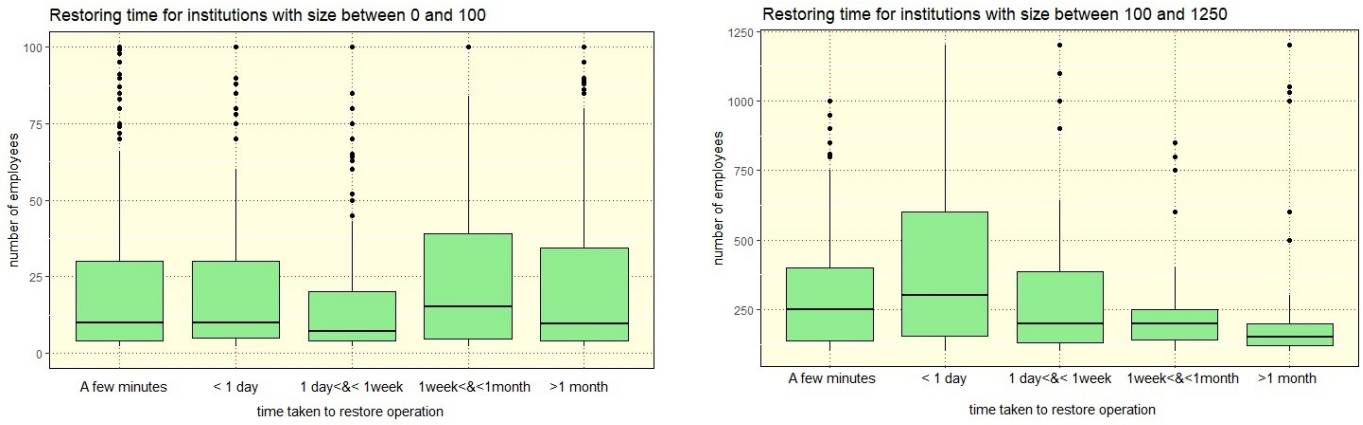

Figure 3: Institution size compared to restoringtime in BoxPlot

0.10 hypothesis testing

To test my hypothesis I started with a simple mean comparison test between the size of the company and each of possible times it took to restore business operations.

Since the restoring time is recorded in multiple scales I cannot use a normal t-test, so I have chosen to use the Analysis of Variance (ANOVA) test to prove my hypothesis. Anova is a statistical test that compares the mean of multiple groups, in this case I have used one-way ANOVA since I am only comparing one one categorical independent variable with 5 levels that is the restoring time take and one quantitative dependent variable, the size of the organisation.

ANOVA output explains how much variation in the dependable variable can be explained by the independent variable, so how much does the time taken to restore affects the size the of the company.

0.11 TODO TABLE WITH ANOVA RESULTS

0.12 Limitations

There are multiple limitations to my analysis to be noted. Firstly, the data collected is limited to cyber attacks that were detected, there is variety of attacks that have gone unnoticed and therefore the data has a systematic tendency to underestimate the real level of breach attacks, it is highly likely that the amount

of cyber attacks is much higher since it is only possible to report the discovered cyber attacks.(Department For Digital 2020)

Secondly, the missing data generated by imputation is biased since not all data is missing completely at random, mainly due to smaller and less staffed institution not having IT professionals and as such they don't have the infrastructure to detect, assess and report cyber attacks. Another source of missing data is from the employees who participates in this survey and exercised their right to not answer some of the questions.

Furthermore the amount of missing data in each of the data sets is significant enough that if the imputed values were replaced with the real data the results could be considerably different because imputed data is not real data and does not account for any biased missing data contributing factor.

Lastly it would be possible to compensate for some bias related to the size of the institutions by implementing weighting to better represent the proportion of the smaller institutions.

0.13 Conclusion and recommendations

Due to the low correlation of this data

## since we want to have access to some proper data we will tidy the
## questions about how big of a priority is cyber security and how
## often are the higher ups updated about it this could really use some
## try catches because for the some weird reason -97 == NA does not
## return true or false, this is like javascript levels of bad

## also excepting this very first one the removals will be at the end
## so they are computed as if they were a transaction because try and
## catch is a lie to sell more lines of codes

## thanks to a blessing for our lord not finding the object only gives
## a warning and we ignore those as long as it still lets run the rest
## of the code

0.16 Management - now is when the policies and procedures are evaluated

```
## manage 1 - Board members/trustees with responsibility for cyber
## security manage 2 - outsourcing cyber security manage 3 - formal
## policy or policies in place covering cyber security risks manage 4 -
## Business Continuity Plan manage 5 - Staff members whose job role
## includes information security or governance //it stopped being used
## after the 2020 survey manage 6 - don't know/missing data manage 7 -
## absolutely nothings, good luck have fun (rip bozzo) manage 8 -
## written list of what is critical to protect (only exists in the
## survey of 2022 not to be used)

## altura de me desemerdar que esta aqui esta mesmo grossa não faz
## frio, nem orvalho, está a chover para caralho converting the final
## value to a collection so I can append all the values //facepalm this
## is where the coping begins, thank goodness no one will ever know
## what I had done here before refactoring and optimising the code

## managementContinuity - there is a business continuity plan (manage
## 4) or there are formal policies implemented (outcome 3)
## managementCyber - board members or trustees have cyber security
## responsibilities (manage 1) or cyber security is being outsourced
## (manage 2) (also known as the at least they tried but no matter how
## funny it is terrible variable name)

0.17 Rules for company policies

```r
## This is where the fun begins with some proper policies simping for
## incremental backups

## rule 1 - applying software updates rule 2 - up to date maleware
## protection rule 3 - well configured firewalls rule 4 - proper
## permission configuration rule 5 - monitoring user activity rule 6 -
## encrypting personal data // only used in 2018 rule 7 - security
## controls on company devices rule 8 - only allowing access from
## company devices rule 9 - segregated guest wireless / so basically a
## DMZ rule 10 - don't know rule 11 - none (YOLO) rule 12 - strong
## passwords //only used in 2018 rule 13 - backup data to the cloud
## (diskette robots in data center go brrrrrrr) rule 14 - backup the
## data to another place that isn't the cloud rule 15 - storing and
## moving data/files securely //wasn't used in 2018 rule 16 - 2 factor
## authentication // only used in 2019 rule 17 - policy for strong
## passwords //not til 2020 rule 18 - VPN (virtual private network)
## //only in 2022 rule 19 - phishing procedure // only in 2022 rule 20
## - authentication when accessing the network // only in 2022

## TODO TODO TODO TODO unduck this mess as well because I just don't
## know anymore good news is that I have a solution, bad news is that
## it is not a perfect solution at least I won't be able to cause a
## stack overflow because with a precision of 53 bits, and represents
## to that precision a range of absolute values from about 2e-308 to
## 2e+308
```

```
## Rules grouping for optimisation

## TODO might have too much in common and separate both security confs
## and updating with .baks

## rulesUpdating - keeping spftware and maleware protection up to date
## (rule 1 and 2) and baking up information ( rule 13, 14 and 15(not in
## 2018 ) ) rulesSecurityConfigs - well configured firewalls and
## permission (rule 3 and 4), DMZ (rule 9) and strong passwords (rule
## 17 not in 2018) rulesUserControl - monitoring user activity (rule 5)
## as well as good security control and access control (rule 7 and rule
## 8)

0.18 Policies

```
## we do a little policing but sadly not the one QoS type on cisco
## servers to be fair it would be as painful to debug

## policy 1 - what can be stored in the removable devices policy 2 -
## remote working policy 3 - what staff are permitted to do on your
## organisations IT devices policy 4 - use of personally-owned devices
## for business activities policy 5 - Use of new digital technologies
## such as cloud computing (seriously what the hell is this question
## smh) policy 6 - data classification policy 7 - a Document Management
## System policy 8 - don't know (estudasses) policy 9 - none of these
## (YOLO) policies 10,11 and 12 were only made in 2022 but since they
## started using policy 11 and 12 instead of the policy 6 and 7 they
## will replace them policy 11 - SaS (software as a service) policy 12
```

```
## - how to store data

## TODO TODO TODO TODO unduck this mess as well because I just don't
## know anymore good news is that I have a solution, bad news is that
## it is not a perfect solution at least I won't be able to cause a
## stack overflow because with a precision of 53 bits, and represents
## to that precision a range of absolute values from about 2e-308 to
## 2e+308

## even better news I have a better solution that will make the code
## run with two legs instead of just half a leg

## policyStaffAccess - staff who is allowed to work remotely (policy
## 2), policing of what staff are permited to do om company devices
## (policy 3) and cloud computing (policy 5) policyData -
## classification of data (policy 6) and document management system
## (policy 7) policyPrivate - staff is not allowed to work on personal
## devices (policy 4) and cannot just store anything on removable
## devices (policy 1)

## now to register both outcome and impact
```

0.19 Outcomes - we check for each of the attack outcoems and group them

```
## for the frequency of attacks in the last 12 months I am not sure if
## I am interested in that data TODO I am temporary removing them if I
## can add thhem back if needed (more interested in the outcome of the
## attacks)

## outcomes from the attacks outcome 01 - Software or systems were
## corrupted or damaged (permanent DDOS) outcome 02 - Personal data was
## altered, destroyed or taken outcome 03 - Permanent loss of files
## (other than personal data) outcome 04 - Temporary loss of access to
## files or networks outcome 05 - Lost or stolen assets, trade secrets
## or intellectual property outcome 06 - Money was stolen outcome 07 -
## (DDOS) website or online services were taken down or made slower
## outcome 08 - Lost access to any third-party services you rely on
## outcome 09 - Don't know (NA) outcome 10 - none of these outcome
## 11,12 and 13 are only present in 2022 so we won't use them to make
## comparisons
```

```
## as the lord and savior Dr Mark Kelson has preached to me on you
## shall merge the multiple outcomes into smaller ones to have better
## correlations If you are reading this one mark don't forget my extra
## points for that one time I had to turn on the system in the computer
## lab because it was turned off the the professors assistants weren't
## there yet to comment it all its ctr+shift+c #FicaADica

## outcomesData - is a combination of personal data was altered
## (outcome2), temporary or permanent loss of access to files (outcome
## 3 and 4) outcomesDDOS - websites or online service was taken down or
## made slower (outcome 7), lost access to any third party services
## (outcome 8) and software or system corruption and damaged (permanent
## DDOS) (outcome1) outcomesTheft - lost or stolen assets, trade
## secrets or intellectual property (outcome 5) and stolen money
## (outcome 6)

0.20 Time take for restoring the systems

```
## there is already some missing data in the form of -97 so remember to
## replace the missing data to the -97 code instead

## also remember the scale restore = 1 - no time at all taken to
## restore the business operation back to normal restore = 2 - less
## than a day taken to restore the business operation back to normal
## restore = 3 - between one day and a week taken to restore the
## business operation back to normal restore = 4 - between one week and
## a month taken to restore the business operation back to normal
## restore = 5 - one or more months taken to restore the business
## operation back to normal restore = 6 - still not back to normal
## restore = -97 or 7(in 2018) - don't know

## we will have to remove the data entries where the system is still
## not back on (restore = 6) because we cannot quantify it in terms of
## times taken and we don't want those entries to have a negative
## effect in both our imputation and correlation
```

```
## checking the labels of the variable restore to see what if there was
## any other value for missing data besides -97 but apparently didn't
## know was not a specific option you could select like in the other
## cleaned variables
val_labels(dataCyberSecuritySurvey2018TidyNameSizeCyber$restore)

```
## remember we must make the imputations before we merge the data of
## all the years

## m= number of imputations maxit = number of iterations

## ppm is for continuous missing data loreg is for dichotomous missing
## data //dichotomous two mutuallu exclusive groups polyreg is for
## categorical missing data // categorical variable can be one of a
## limited, and usually fixed number of values aka its discrete norm is
## Bayesian linear regression without predictive mean matching TODO
## maybe write this one the report

## ok so we should have maxit(number of iterations) around 20-30
## (preferably less) but tweak it so the plot(generated by the
## iterations have a good convergence otherwise it will be inaccurate)
## // when the lines reach a value and fluctuate slightly around it,
## convergence has been achieved

## iteration 0 - per imputed dataset at iteration number 0 values are
## randomly drawn iteration 1 - At this step the first variable values
## are set back to missing. Subsequently, a linear regression model is
## applied in the available data iteration 2 - the same procedure is
## repeated for the next variable and so on
```

(“Book_MI.knit” 2022)

```
## as we can see in Rubin's works the larger the number of data sets
## the larger the error will meaning a finite number of imputations is
## favorable to an infinite number of imputations RE=1/(1+(FMI/m))
```

(Rubin 1975)

```
## in White, Royston, and Wood book "Multiple imputation using chained
## equations: Issues and guidance for practice' they proposed the rule
## of equating the number of imputations to the percentage of missing
## data in each of the data sets which is what I will be using
```

(White, Royston, and Wood 2010)

0.24 Data Imputation

```
## absolute chad that I am saving
## https://stats.stackexchange.com/questions/219013/how-do-the-number-of-imputations-the-maxim

## we will release the krakens after all the testing and debuggins

## we actually don't want to specify the method here because mice will
## automatically choose between logression and polyregression for the
## values depending on the R data structure and is simpler then doing
## it manually while giving the same result

## remember mice does not support haven_labell so they all have to be
```

```
## removed and converted to another data structure in native R

## first step of the imputation workflow
## //https://stefvanbuuren.name/fimd/workflow.html

imp2022 = mice(dataCyberSecuritySurvey2022TidyNameSizeCyber, m = 18, maxit = 21,
    predictorMatrix = predictorMatrix2022)
imp2021 = mice(dataCyberSecuritySurvey2022TidyNameSizeCyber, m = 19, maxit = 22,
    predictorMatrix = predictorMatrix2021)
imp2020 = mice(dataCyberSecuritySurvey2022TidyNameSizeCyber, m = 16, maxit = 21,
    predictorMatrix = predictorMatrix2020)
imp2019 = mice(dataCyberSecuritySurvey2022TidyNameSizeCyber, m = 15, maxit = 21,
    predictorMatrix = predictorMatrix2019)
imp2018 = mice(dataCyberSecuritySurvey2022TidyNameSizeCyber, m = 18, maxit = 21,
    predictorMatrix = predictorMatrix2018)
```

```
## just so the rendering of the pdf doesn't take more than 1 hour of
## imputations alone I will leave 3 imputations here for rendering
## purposes since if I just turned off that code chunk I wouldn't be
## able to run the rest and I just couldn't save the load the
## imputations has a csv

imp2022 = mice(dataCyberSecuritySurvey2022TidyNameSizeCyber, m = 3, maxit = 21,
    predictorMatrix = predictorMatrix2022)
```

```
## convergence is achieved when after plotting the variance between the
## imputation chains is an aproximate to the variance of the chained
## imputions, this behavor is an indicator of an healthy convergence.
```

("Book_MI.knit" 2022)

0.26 Fitting the model after the imputations

```
## continuing from here because otherwise the reference won't work

## the mice library already turned on the relevant variable for the
## imputation modelling turning only the imid(unique id) and year
## variable which is not useful for the imputations done on a year to
## year basis therefore I don't need to tweak it manually using pred
## <-imp$predictorMatrix

## I might disable the size, priority or updates if needed though but
## they seemed to be needed since they make the amount missing values
## depends on these (basically auxiliary variables)

## https://stefvanbuuren.name/fimd/workflow.html // go to 5.1 mice
## documentation is *chef's kiss*

## the imputations are done so now we will use the with function from
## mice to fit the model 2nd workflow step

## hypotheses bigger organisations take longer to recover from cyber
## attack due to the sheer volume of data in their possession

fitModelBase = with(imp2022, lm(sizea ~ restore))

## now lets test with all the variables

## the with function has 2 functions, fill the missing value and then
## do the analysis, this way we avoid having to use complete function
## to gather all the data and then use the lappy to fit he model
`?`(with)
```

```
starting httpd help server ... done
```

```

0.29 One-way ANOVA testing between each of the scales of company sizes

```
## https://www.scribbr.com/statistics/one-way-anova/

## hypothesis testing

mod = aov(sizea ~ restore, data = displayed2022)

summary(mod)
```

```
              Df    Sum Sq   Mean Sq F value Pr(>F)
restore        4 2.071e+08  51768980   0.438  0.781
Residuals   2149 2.538e+11 118117849
```

```
## anova output explains how much variation in the dependable variable
## (size) can be explained by the independent variable (restore), so
## how much does the time taken to restore affects the size the of the
## company

## the Sum sq (sum of squares) (aka total variation) between the group
## means and the entire mean of the variable

## F-value is the independent variable divided by the mean square of
## each of the residuals ( the bigger this value the more likely it is
## that the variation is real and not due to chance)

## p-value is how likely it is for the test to run on the null
## hypothesis
```

0.30 Graphing the correlation between size and restoring time

```
##ok so i need to adjust the predictor of sizea so it is only predicted by sizeb

# ggplot(displayed2022, aes(x=sizea, y= restore)) + # ggplot with the desired data
#   geom_boxplot(fill='lightgreen',colour='black') + # Specifying boxplot

0.31 Quarto

Quarto enables you to weave together content and executable code into a finished document. To learn more about Quarto see https://quarto.org.

0.32 Running Code

When you click the **Render** button a document will be generated that includes both content and the output of embedded code. You can embed code like this:

```
1 + 1
```

```
[1] 2
```

You can add options to executable code like this

```
[1] 4
```

The `echo: false` option disables the printing of code (only output is displayed).
